## Standard Components

The lowest cost and shortest delivery schedules are normally achieved through the use of standard worm and gear sets described in this catalog.

In addition to using standard shaft center distances, ratios and bearing mounting parts, designs should also include standard bores, flanges, and bolt circles where possible. Since the use of non-standard hubs is not uncommon to the worm gear industry, Delroyd provides for this by having a flanged rim design available for mounting on any adaptable center.

## Casing Design

When designing the casing used in the Delroyd worm gear speed reducer line, consideration was given to the accepted need for ruggedness, together with the requirements of retaining the lubricant, supporting bearings, excluding dirt and moisture, and dissipating heat.

On most applications for which worm and gear sets are purchased, the size and configuration of the casings are determined by the general requirements of the machine into which the set will be installed. In these cases, the area for heat dissipation is usually much greater than that of the standard reducer. Thus, the resulting temperature rise will be maintained well within the accepted industry limit of 100° F over ambient, without any auxiliary cooling. Where a separate box is to be designed for the worm and gear set, the same approximate casing proportions as used in the standard Delroyd reducer can be followed, provided fan cooling or some other form of auxiliary cooling is available. When continuous operation without auxiliary cooling is anticipated, a corresponding increase in casing area will be required.

## Case Machining For Proper Backlash

In any type of gearing a certain amount of backlash is required for satisfactory operation. Clearance must be provided to accommodate an oil film and to allow for thermal expansion. The amount of backlash provided is not of particular importance

in most applications. Closer limits than required will result in unnecessary higher costs and should naturally be avoided. It is important, however, to recognize where minimum backlash may be required to insure proper equipment functioning. Close limits are most often specified for accuracy of index or timing. In other instances, it may be advantageous to specify minimum backlash for limiting the stress at the gear teeth caused by shock loading - such as a reverse overriding impact load.

Listed below are standard extreme allowable backlash limits for standard sets, measured by a "circular shake" movement at a radius equal to the gear pitch radius. In machining the housing the center distance should be held within the right hand column tolerance. Any change over this will provide increased backlash measurement.

## Extreme Allowable Backlash Limits For Standard Sets\*

Center Distance	Normal Circular Shake Backlash Assembled	Using Center Distance Case Bore Tolerance
2.000	.003/.013	+.002/-.000
2.500	.003/.013	+.002/-.000

\*All dimensions in inches.

## Ratings

Ratings are given on pages 6-30 Refer to Delroyd catalogs 8804 and 7000 for complete selection procedure.

## Worm Bearing Fits And Adjustments

Dimensions, "MC", "MD", "MG" and "MH" (2" through 7" sizes) on pages 46 and 47 illustrate case bore dimensions for designer use in specifying correct component fit. Dimension "MH" represents the bearing manufacturer's recommended bore tolerance and dimension "MG" the bearing clearance bore. The same bores are used on both sides of the assembly. Bearing endplay should be adjusted to the following by use of shims at the bearing covers:

2" through 4" size .003 to .007"

5" through 7" size .006 to .010"

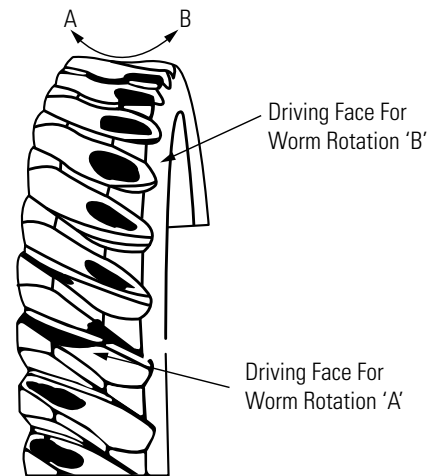

Housing bore dimensions on pages 40 through 52 (8" through 48" sizes) again represent recommended case machining tolerances. Dimension "MH" (8" through 12" sizes) is the thrust bearing manufacturer's recommended fit and the proper radial bearing housing case bore. Sizes 14" through 20" use a tapered roller radial bearing housing mounted in case bore dimension "MH". Sizes 21.837" through 48" use tapered roller bearings mounted directly in case housing bores "MH" and "MN". Worm thrust bearings with spacers are not adjustable and the bearing retainer should be pulled up tight to assure clamping of the cups and cup spacer. Proper end-play has been designed into the bearing spacer. No adjustment is required on the spherical or tapered roller bearings on the 8" through 48" sizes.

## Location Of Contact

Provision for adjustment of the gearing at assembly cannot be overlooked. The worm, having threads that are continuous in form, is not critical in regard to endwise location. The gear, however, must be precisely located in an axial position. In most assemblies the accumulation of tolerances on the dimensions of housings, shafts, bearings and gear makes it impractical to control the location of the gear by accuracy of machining alone. Correct positioning is normally achieved by shimming the gear at assembly.

All gears are produced to allow for deflection and to provide an entry gap for lubricant on the "entering side" of the gear teeth. Therefore, contact on the driving face of the worm gear tooth is required on the "leaving side" as shown in the top figure. Contact should be checked after the worm and gear have been installed by coating the threads of the worm with Prussian blue and turning gears in mesh by hand.

The contact surface can easily be shifted by changing shims at the opposite end of the gear shaft to move the gear to the right or left of the worm. In doing this, once bearing adjustment is made, shims should not be added or removed simply moved from under one cover to the other. When assembling a worm gear which has to run in both directions of rotation, it is necessary to consider both driving faces of the teeth and to aim at contact as shown in the bottom figure. Note that both faces have a leaving side contact in relation to the corresponding direction of rotation of the worm. This is an inherent feature of Delroyd worm gearing as the worm deflects under load, contact moves toward the center of the gear tooth but still maintains some gap for lubricant on the entering side.

## Lubrication

Worm gear performance depends on the ability of the lubricant to reduce friction on, and carry heat from, the working surfaces. Recommended lubricants are those meeting requirements out-lined in Table #8, American Gear Manufacturers Association Specification #250.04, for cylindrical worm gearing. In the usual lubrication system, oil contained within the housing is directed by splash to the bearings and to the zone of tooth and thread contact. Natural splash can be augmented by flingers, scrapers and cups attached to the gear. Channels or ribs can be placed inside the housing to help direct oil to bearings. For splash lubrication the recommended lubricant levels are (1) worm-below-gear: level at center of worm; (2) worm-above-gear: level a 1/6 of gear diameter; and (3) worm-beside-gear: level at center of worm and gear. To avoid excessive oil churning, pressure lubrication is advisable where speeds are high. This method is also advisable for worm-mover-gear arrangements operation at speeds too slow to assure satisfactory lubrication. With this system an oil cooler in the pipeline can be used to good advantage.

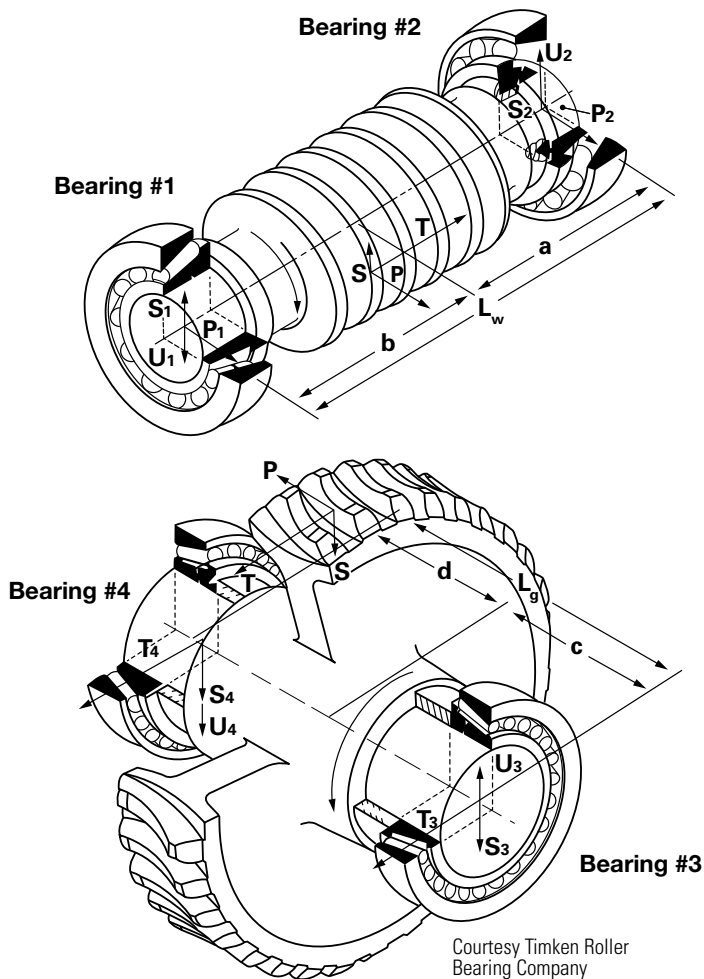

# Engineering Information

## BEARING SELECTION

Careful consideration should be given to selection of bearings in order to locate adequately the gearing, and support the loads involved. A procedure for calculating bearing loads is presented on this page. The use of standards is recommended wherever design considerations permit.

## HOW TO CALCULATE BEARING LOADS

Friction Angle  $\phi$

## GEARS

Integral gear and hub assemblies from standard Delroyd reducers are available as shown on page 53. This tabulation also shows flanged rim designs, size 3 1/2" center distance and larger, suitable for bolting to any adaptable center. Flanged rims fit the center in the counterbore only and a shrink fit is recommended where the gear is to transmit rated loads. This is necessary due to the differential rate of expansion between bronze and the center material, and insures positive location of the rim at maximum operating temperature. The flanged rim locating dimension is shown on page 53 as dimension "K". Also listed is the hub outside diameter "U" necessary to provide a recommended ASA Class FN-2 shrink fit. Assembly can easily be facilitated by heating the rim to about 200°F. This will cause sufficient expansion to permit center insertion for bolt hole alignment. Lightly loaded applications, where operating temperatures stay reasonably under the normal 180° F range, can use a free fit. The interference fit should also be avoided on applications involving less than standard backlash.

### Principal forces and bearing loads in a worm and gear set.

$P$	$= Q/WPR$
$S$	$= P \tan NPA/\sin (LA+ \phi)$
$T$	$= P / \tan (LA+ \phi)$
$V_s$	$= .262 (WPD) (RPM) / \cos LA$

where

WPD	is	pitch diameter of worm, inches
WPR	is	pitch radius of worm, inches
GPR	is	pitch radius of gear, inches
LA	is	lead angle of worm, degrees
P	is	tangential force of worm, pounds
Q	is	torque input to worm, inch pounds
S	is	separating force, pounds
T	is	axial thrust of worm, pounds
NPA	is	normal pressure angle, degrees*
$\phi$	is	friction angle for worm driving, degrees
RPM	is	worm speed, RPM
$V_s$	is	rubbing speed, feet per minute

\*20° for C.D. 2.000", 3.500", and 14.000"

through 48.000".

22 1/2° for C.D. 3.000", and 4.000" through 12.000".

T	$T(WPR)/L_w = U_1$	$T(WPR)/L_w = U_2$	$T(d)/L_g = T_3$	$T(c)/L_g = T_4$
Radial Load	$\sqrt{P_1^2 + (S_1 - U_1)^2}$ =R1	$\sqrt{P_2^2 + (S_2 + U_2)^2}$ =R2	$\sqrt{T_3^2 + (U_3 - S_3)^2}$ =R3	$\sqrt{T_4^2 + (S_4 + U_4)^2}$ =R4
Thrust Load		T		P

## Approximate WR<sup>2</sup> Values

Assuming uniform acceleration (or deceleration), the motor torque required to accelerate - or the brake torque required to decelerate - in a given time can be determined by the following:

$$T = \frac{WR_{ws}^2 \times \Delta N}{3690t}$$

where

$$T = \text{Torque in inch pounds}$$

$$WR_{ws}^2 = \text{lb-in}^2$$

$$\Delta N = \text{RPM change}$$

$$t = \text{Time in seconds}$$

Listed in the table are approximate WR<sup>2</sup> values for standard single extended worm gear assemblies and standard low speed shaft assemblies for sets shown in this catalog.

$$WR_{ws}^2 = \frac{WR_{LSS}^2 \times WR_{DL}^2}{(\text{ratio})^2} + WR_{WA}^2 + WR_M^2$$

where

$WR_{ws}^2$  is  $WR^2$  of the system with respect to input shaft

$WR_{LSS}^2$  is  $WR^2$  of the reducer low speed shaft assembly

$WR_{DL}^2$  is  $WR^2$  of the driven load

$WR_{WA}^2$  is  $WR^2$  of the worm assembly

$WR_M^2$  is  $WR^2$  of the motor

Center Distance	WR <sup>2</sup> Worm Assembly lb-in <sup>2</sup>	WR <sup>2</sup> Low Speed Shaft Assembly* lb-in <sup>2</sup>
2.500"	.36	10.0
3.000"	1.40	20.0
3.500"	1.58	53.0
4.000"	3.30	114
5.000"	8.52	265
6.000"	15.4	633
7.000"	16.3	1,220
8.000"	38.7	2,250
9.000"	55.3	4,020
10.000"	76.4	6,700
12.000"	151	17,300
14.000"	369	23,800
17.000"	513	66,300
20.000"	1,920	174,000
21.837"	2,150	215,000
24.000"	3,560	487,000
27.000"	6,510	566,000
30.000"	7,910	945,000
36.000"	10,600	2,140,000
42.000"	26,800	4,420,000
48.000"	31,700	8,030,000

\*Below 12" center distance, this value represents a complete gear and not just a flanged rim. For 12" and greater center distances, the  $WR_{LSS}^2$  consists of a flanged rim plus a gear center approximating the size of the gear center used in standard Delroyd units.

## Service Factors

Tables in this catalog provide mechanical ratings in terms of input horsepower and inch-pounds output torque. Mechanical ratings reflect gearing wear capacity. Values in the rating tables apply for continuous service, free from recurrent shock loading, and of total duration up to ten hours per day. Normal starting or momentary peak loads up to 300% of this rating are permissible for a maximum period of two seconds duration. The total number of 300% peak loads is limited to 25,000 over the life of the reducer. Use of service factors is necessary dependent on actual nature and duration of service. The terms specified in the service factor table "intermittent" and "occasional" refer to total operating time per day while the term "frequent starts and stops" refers to more than ten starts per hour.

## Service Factors

		Driven Machine AGMA Load Classification		
		Uniform	Moderate Shock	Heavy Shock
	Duration of Service	(Peak Load of 100% of Driver Hp.)	(Peak Load of 125% of Driver Hp.)	(Peak Load of 150% of Driver Hp.)

# Recommendations and Precautions

## Important

Read before selecting, installing, operating or maintaining Delroyd reducers. **WARNING: SELECT, INSTALL, OPERATE AND MAINTAIN DELROYD EQUIPMENT ONLY IN ACCORDANCE WITH THE FOLLOWING INSTRUCTIONS, AND DELROYD CATALOGS AND INSTRUCTION BOOKS. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN SEVERE BODILY INJURY AND PROPERTY DAMAGE. CONTACT DELROYD TO GET CATALOGS AND INSTRUCTION BOOKS** All catalog information, warning tags, these instructions, all special or general instruction manuals, parts lists, maintenance instructions, and drawings must be kept with the reducer.

## I. Safe Operation Depends on Selecting the Proper Reducer

### A. Selection Responsibility

1. Delroyd Customers are responsible for selecting proper reducers.
2. Delroyd customers must select reducers that can be used in accordance with Delroyd criteria concerning transmitted horsepower, speed, applied external loads, applied axial thrust loads and applicable service factors. Use of Delroyd reducers must conform to all such criteria.
3. Customers requesting recommendations from Delroyd concerning reducer selection must provide accurate and complete information concerning all operation variables that may be encountered in the proposed reducer application. Such variables include but are not limited to loads, speeds, shock, ambient temperature and published Delroyd service factors.

### B. Reducer Compatibility with the Drive System

1. When selecting a reducer, the customer must analyze the motor, reducer, driven machine and all connecting parts for compatibility, critical torsional or other vibrations and other applicable forces during all modes of operation.
2. The customer should request Delroyd assistance in selecting a reducer if conditions such as overloads during starting, momentary peak or stalling loads, high inertial starting or stopping systems, reversing direction of rotation, over-running operations, corrosive or dusty atmospheres or ambient temperatures under 20°F or over 100°F might be encountered.
3. When selecting a motor for a Delroyd reducer, NEMA (National Electrical Manufacturers Association) Standards Publication MG2 (Safety Standards for Construction and Guide for Selection, Installation and Use of Fractional and Integral Horsepower Motors and Generators) must be obtained and studied. Electrical and other motor hazards should be considered. In all instances the motor manufacturer's instructions should be followed carefully. Such instructions must be obtained from the motor manufacturer directly or through Delroyd.

## II. Installation of Delroyd Reducers

### A. Upon Receipt of Shipment

1. Examine the equipment for damage and corrosion. Report any discrepancy to the shipper, and to Delroyd for replacement or repair.
2. Examine the reducer nameplate and motor nameplate (if a motor is also supplied) to be sure the proper equipment has been received.
3. Do not remove these name plates. They are provided to identify the model number, size and serial number so that Delroyd can supply the proper spare or replacement parts to you or any subsequent owner. The information on name plates also enables the user to check manufacturer's publications for instructions concerning proper application, installation, operation and maintenance of reducers and motors.
4. Study and retain all warning tags, instruction, parts lists and parts drawings received with the shipment or sent separately.

### B. Installation

1. Follow Delroyd installation instructions and the instructions of the motor manufacturer.
2. Provide proper OSHA conforming safety guards for couplings, exposed rotating shafting, belts or chains on your Delroyd reducer installation.

3. Lifting eyebolts or other lifting devices supplied with the reducer are designed for raising the reducer only. They should not be used to lift the reducer plus other components, and should be removed after installing the reducer.
4. All Delroyd reducers are shipped without oil. Add oil to proper oil level before starting. Allow sufficient time for the oil to fill all parts of the reservoir and recheck the level.

## III. Operation of Delroyd Reducers

### A. Before First Starting the Reducer

1. Disconnect the reducer from its driving motor and check motor rotation. Reverse motor rotation if necessary and reconnect the reducer.
2. Rotate the motor and reducer by hand to be sure all components turn freely.
3. Replace all safety guards.
4. Review reducer operating instructions, lubrication schedules, and maintenance schedules.
5. Review Motor manufacturer's operating instructions.

### B. Fan Precautions

Most Delroyd reducers are equipped with a fan for cooling the reducer. This fan is guarded, but must have inlet and outlet air openings to provide the necessary air movement. To avoid severe bodily injury or property damage:

1. Do not remove the fan guard or insert fingers or other objects into the air openings when the reducer is operating.
2. Shut down and lock out the motor driving the reducer before the fan or fan guard is removed or in any way adjusted.

### C. Inspections

As with all mechanical equipment, a program of regular inspection is important to prolong equipment life and to safeguard people and property.

1. Periodic inspection of the reducer must be made every 2,000 hours of operation or every six (6) months, whichever such period expires earlier.
2. The above inspection must also be conducted after each time the reducer has been subjected to any overload, or stall condition or loss of lubricant.
3. Reducer parts that are damaged or worn, or the presence of contaminants (such as water, dirt, bronze or steel particles) in drainage oil could indicate impending failure. An increase in noise, a drastic increase in backlash, an increase in motor HP required, or other erratic behavior of the reducer could indicate impending failure.
4. If any of the above conditions are observed, the reducer should be immediately taken out of service until the cause of the condition is determined and corrections made. Consult Delroyd for assistance. Failure to immediately remove such a reducer from service could result in loss of control of the driven machine and consequent severe bodily injury or property damage.

## IV. Maintenance of Delroyd Reducers

- A. Care should be exercised when draining oil during lubricant replacement. Oil temperatures of 180°F to 200°F can normally be expected and severe burns could result if oil contacts personnel or their clothing.
- B. Before beginning removal or disassembly of any part of your Delroyd reducer for maintenance or inspection, lock out the driving motor control panel to prevent inadvertent starting and disconnect driven load.
- C. Repairs can be done by Delroyd using factory stocked or manufactured parts if the reducer can be returned to our plant in Niagara Falls, New York. If repairs are done elsewhere, all instruction book adjustments must be followed and Delroyd manufactured parts must be used.
- D. The motor manufacturer's instructions should be followed carefully in performing motor maintenance.

# Premier Industrial Company Leading Brands

## OTHER PRODUCT SOLUTIONS FROM **REGAL REXNORD**

Our comprehensive product offerings include various types of clutches and brakes, overrunning clutches, engineered bearing assemblies, gearing and gear motors along with linear motion products, belted drives, couplings, limit switches, precision motors, drives & controls, and miniature motors. With thousands of product solutions available, Regal Rexnord provides true single source convenience while meeting specific customer requirements. Many major OEMs and end users prefer Regal Rexnord products as their No. 1 choice for performance and reliability.
